

Automated Tracking of Biological Cells

Lance Rice

Automated Cell Tracking

- Biological cell cultures
- Prerecorded microscopy video
- Maintain location of every cell over entire video

Why it Matters

- Incredible Amount of
 - Diversity
 - Volume

Toxins

Ecological Factors?

Toxins

-9.0 μm

Prymnesium parvum (P. parvum)

βιλαυεζιουα βειλουα (β' βειλουα)

(Recorded experiments) x 12

- ~100 cells
- ~1000 frames

(100 clicks) x (1000 frames) x (12 Videos) =

1.2 MILLION CLICKS!

- Completeness

Method Overview

- Detection
- Association (Low)
- Association (High)

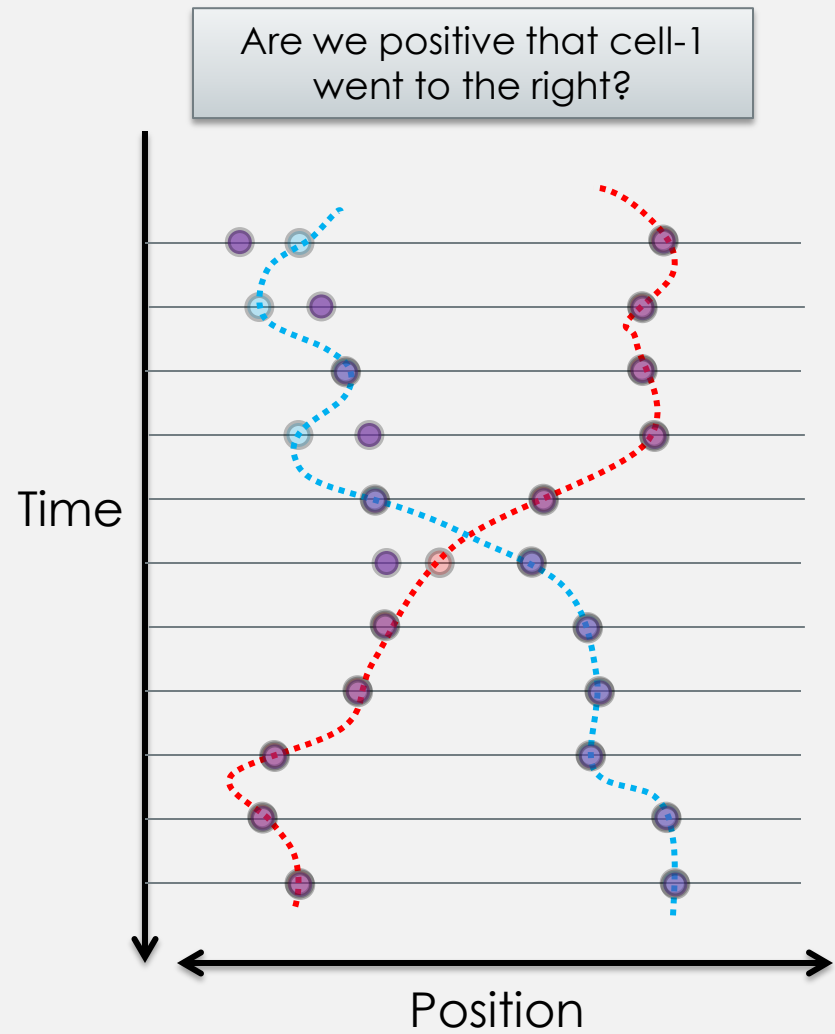

Challenges

- Detection
 - Missed Detections

Challenges

- Detection
 - Missed Detections
 - Detection noise

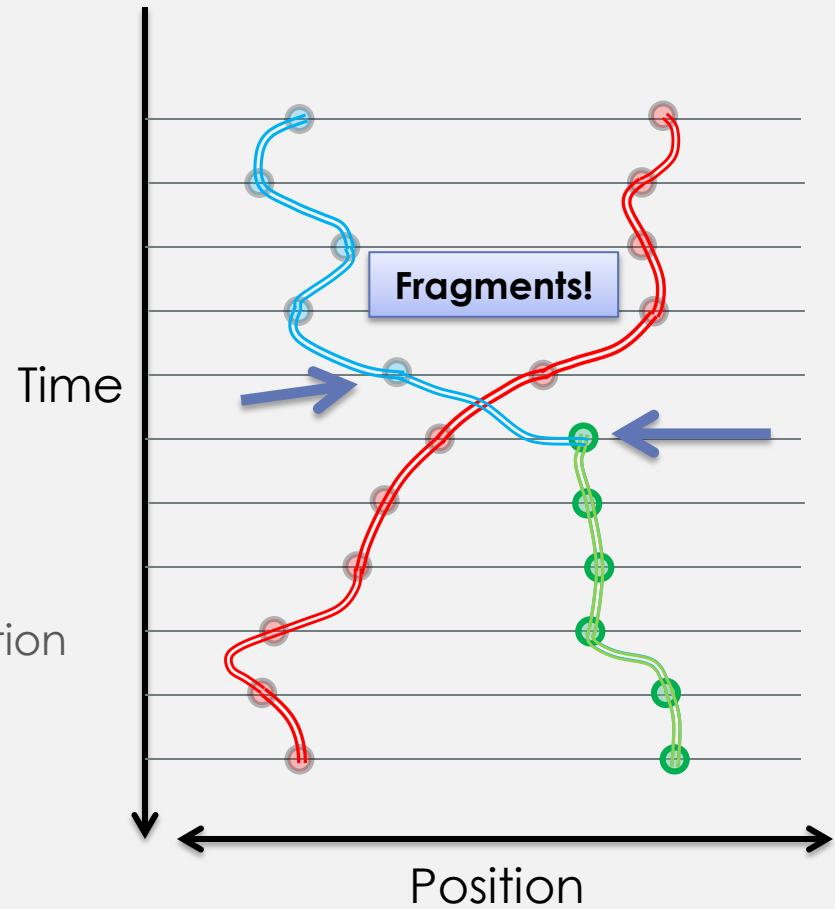

Challenges:

- Detection
 - Missed Detections
 - Detection noise
- Association
 - Incorrect Matches

Challenges:

- Detection
 - Missed Detections
 - Detection noise
- Association
 - Incorrect Matches
 - Failed to make any connection

Detection

Experimented with 3 approaches

1. Circle Fitting

Correct Answer

Result

Detection

1. Circle Fitting
2. Watershed

Correct Answer

Result

Detection

1. Circle Fitting
2. Watershed
3. Distance Fitted Ellipse

Correct Answer

Association

	Low Level	High Level
Position	✓	✓
Size	✗	✓
Motion Pattern	✗	✓
Appearance	✗	✓
Gap Connections	✗	✓

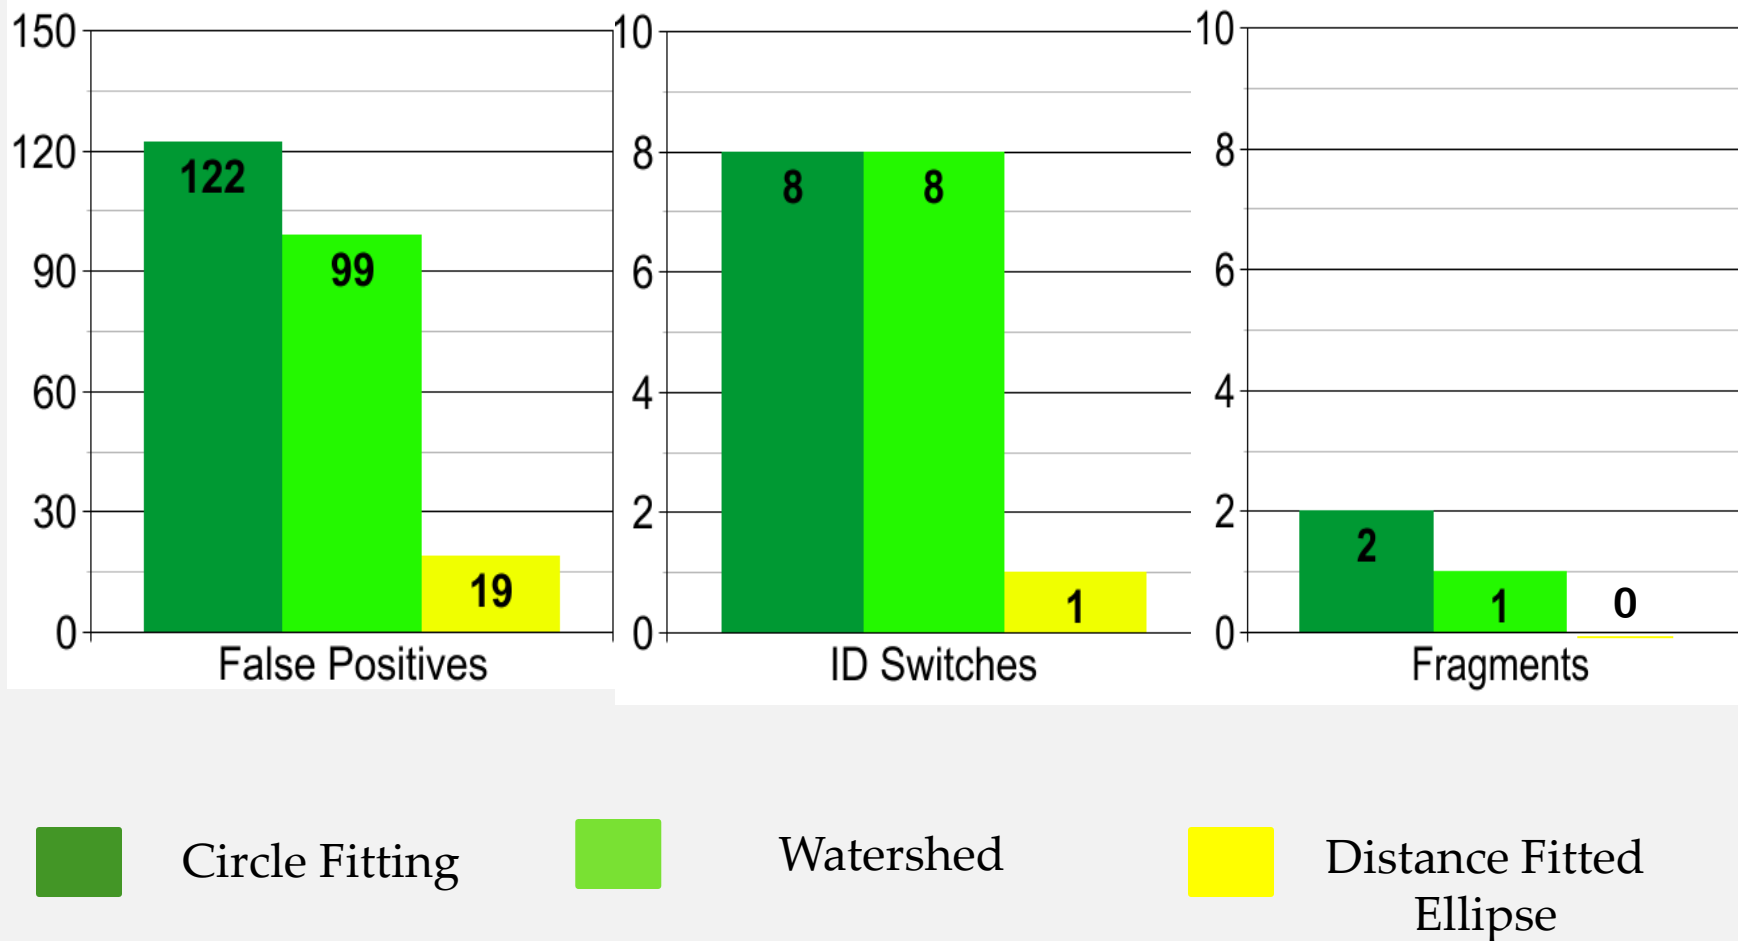

Results (cont.)

Conclusions

- P. Parvum tracking on low quality video
- Improvements through better Detection
- Problem areas
 - False Positives & ID switches
 - Dropped tracks

The Next Step

Trained Detector

- Expand on variety of data

Area	?
Color	?
Shape	?
Proximity	?

The Next Step

- Visualization of cell motion patterns

The Next Step

- Cluster analysis
